P. 388

In a case where a writable optical disk is used as an optical disk B, or in a case where other magnetic medium such as an IC card is used for distributing key information...

Normally, data on the optical disk can be divided into data files recorded with data contents themselves and positional information files used by an information management unit to manage the data files. The positional information files correspond to a directory file and a path table of MS-DOS and ISO 9660 standards. The positional information files are recorded with identifiers, sizes, and top addresses, and the like of the data files.
